Core Lab Interaction

Homework 3

Your assignment is to copy code from the internet

https://cssanimation.rocks/clocks/

1. Your final product will be one file: "**clock.html**", containing both css and html
2. **Ignore the javascript!** Javascript begins with the section: "The correct time". This is where your assignment stops, don't include anything past this point.

review each line as you copy:

- This is an introduction to CSS Animations, keep in mind, you're going to come across code that introduces changes in **time** and **position**
- Read each line as you copy and paste, look for commands you've never typed before. ***Think about what they might do.*** In class we're going to talk about these.

make these changes:

- the url that points to "ios_clock.svg" needs the correct directory structure.
  - *I put the image file and .html file in the same folder and removed all directories*
- add this line to the top of your CSS: **body{ background-color:#ccc; }**
- after you paste in the CSS, look for .clock class definition and adjust "**width:20em**" until it looks good (I set mine to `width:40em`)

to review, your HTML page will start with this:

```
<!DOCTYPE html>
<html>
<head>
<style>
  css goes here
</style>
</head>
<body>
  html goes here
</body>
</html>
```
